Sens.ùs decides to invest in safety and protection of its customers by using innovative antibacterial paints.

In this period of health emergency, **Sens.ùs** has chosen to adopt innovative safety measures **to protect its customers**. In collaboration with the supplier **Grafiche Sabbioni**, the brand invests in **antibacterial paints** for Sens.ùs colour cases.

Viruses can survive on surfaces such as paper or plastic for up to 9 days.

The antibacterial paints used by printers are intended **to ensure an uncontaminated and, above all, non contaminable final product**, thanks to the *singlet oxygen* contained in them, activated by natural light.

Scientific studies carried out on antibacterial paints show that **singlet oxygen effectively destroys enveloped and unwound viruses**, influenza viruses, herpes viruses, Noroviruses and HIV.

Furthermore, the antiviral effect has also been verified for viruses in suspension, on surfaces and on virus-infected cells.

To find out about the new paints used for the boxes, visit the website www.ilovesensus.it.
